A Bug in Someone Else's Code

```
import pandas as pd

def f(x, a):
    return x.sum() + a

df = pd.DataFrame([1, 2])

print(df.agg(f, 0, 3))
```

A Bug in Someone Else's Code

```
import pandas as pd

def f(x, a):
    return x.sum() + a

df = pd.DataFrame([1, 2])

print(df.agg(f, 0, 3))
```

Running this fails with pandas == 1.1.3:

```
$ python pandas_example.py
Traceback (most recent call last):
  File ".../pandas/core/frame.py", line 7362, in aggregate
    result, how = self._aggregate(func, axis=axis, *args, **kwargs)
TypeError: _aggregate() got multiple values for argument 'axis'

The above exception was the direct cause of the following exception:

Traceback (most recent call last):
  File "pandas_example.py", line 8, in <module>
    print(df.agg(f, 0, 3)) # Raises TypeError
  File ".../pandas/core/frame.py", line 7368, in aggregate
    raise exc from err
TypeError: DataFrame constructor called with incompatible data and dtype:
  _aggregate() got multiple values for argument 'axis'
```

A Bug in someone else's code

`DataFrame.agg(func=None, axis=0, *args, **kwargs)`

[\[source\]](#)

Aggregate using one or more operations over the specified axis.

New in version 0.20.0.

Parameters: **func** : *function, str, list or dict*

Function to use for aggregating the data. If a function, must either work when passed a DataFrame or when passed to DataFrame.apply.

axis : *{0 or 'index', 1 or 'columns'}, default 0*

If 0 or 'index': apply function to each column. If 1 or 'columns': apply function to each row.

***args**

Positional arguments to pass to *func*.

****kwargs**

Keyword arguments to pass to *func*.

A Bug in someone else's code

`DataFrame.agg(func=None, axis=0, *args, **kwargs)`

[\[source\]](#)

Aggregate using one or more operations over the specified axis.

New in version 0.20.0.

Parameters: **func** : *function, str, list or dict*

Function to use for aggregating the data. If a function, must either work when passed a DataFrame or when passed to DataFrame.apply.

axis : {0 or 'index', 1 or 'columns'}, default 0

If 0 or 'index': apply function to each column. If 1 or 'columns': apply function to each row.

REGR: Dataframe.agg no longer accepts positional arguments as of v1.1.0 #36948

 Closed **pganssle** opened this issue 3 days ago · 0 comments

pganssle commented 3 days ago

Contributor  

Currently, passing any positional arguments to the `*args` parameter of `DataFrame.agg` fails with a `TypeError`, but the documented behavior is that positional and keyword arguments are passed on to the function that you are aggregating with. A minimal reproducer:

```
import pandas as pd  
  
def f(x, a):
```

REGR: Allow positional arguments in DataFrame.agg #36950

Merged **simonjayhaw...** merged 4 commits into `pandas-dev:master` from `pganssle:fix_agg` yesterday

Conversation 6 Commits 4 Checks 14 Files changed 3 +30 -1

pganssle commented 3 days ago • edited Contributor

Although `DataFrame.agg` is documented as accepting `func`, `axis`, `*args`, `**kwargs` with `*args` and `**kwargs` passed to `func`, passing positional arguments raises a `TypeError`.

The reason for this is that the internal call to `self._aggregate` uses a keyword argument (`axis`) before passing `*args` and `**kwargs`, and as such the first positional argument is always interpreted as a second specification of `axis`, which raises `TypeError`.

What's new in 1.1.4 (??)

These are the changes in pandas 1.1.4. See [Release notes](#) for a full changelog including other versions of pandas.

Fixed regressions

- Fixed regression in `read_csv()` raising a `ValueError` when `names` was of type `dict_keys` ([GH36928](#))
- Fixed regression where attempting to mutate a `DateOffset` object would no longer raise an `AttributeError` ([GH36940](#))
- Fixed regression where `DataFrame.agg()` would fail with `TypeError` when passed positional arguments to be passed on to the aggregation function ([GH36948](#)).
- Fixed regression in `RollingGroupby` with `sort=False` not being respected ([GH36889](#))
- Fixed regression in `Series.astype()` converting `None` to `"nan"` when casting to string ([GH36904](#))

More details about the practical aspects: <https://ganssle.io/talks/#contributing-oss-pydata2018>

What can go wrong?

- Production deadlines
- Long upstream release cycles
- Long deployment cycles in-house

PEP 602 -- Annual Release Cycle for Python

| | |
|-----------------|---|
| PEP: | 602 |
| Title: | Annual Release Cycle for Python |
| Author: | Łukasz Langa <lukasz at python.org> |
| BDFL-Delegate: | Brett Cannon (on behalf of the steering council) |
| Discussions-To: | https://discuss.python.org/t/pep-602-annual-release-cycle-for-python/2296/ |
| Status: | Accepted |
| Type: | Informational |
| Created: | 04-Jun-2019 |
| Python-Version: | 3.9 |

One-off Workarounds

```
def f(x, a):  
    return x.sum() + a  
  
df = pd.DataFrame([[1, 2], [3, 4]])  
  
# Passing `a` by position doesn't work in pandas >=1.1.0,<1.1.4  
# print(df.agg(f, 0, 3))  
print(df.agg(f, 0, a=3))
```

Reasonable if:

- You only hit the bug in one place.
- The workaround is very simple
- You are indifferent between the bug-triggering and workaround code.

Wrapper functions

```
def dataframe_agg(df, func, axis=0, *args, **kwargs):
    """Wrapper function for DataFrame.agg.

    Passing positional arguments to ``func`` via ``DataFrame.agg`` doesn't work
    in ``pandas >=1.1.0,<1.1.4``. This wrapper function fixes that bug in
    affected versions and works normally otherwise.
    """

    if args:
        def func_with_bound_posargs(arg0, **kwargs):
            return func(arg0, *args, **kwargs)

        func = func_with_bound_posargs

    return df.agg(func, axis=axis, **kwargs)

print(dataframe_agg(df, f, 1, 3))
```

- Encapsulates complicated workaround logic.
- Provides an easy target for later removal.

Wrapper functions: Opportunistic upgrading

**I'll Clean Up
That Technical
Debt Later**

**And
Other Hilarious Jokes
You Can Tell Yourself**

*Special 40th Anniversary
"#TODO Comments" Edition*

ganssle.io

@pganssle

Opportunistic upgrading

```
def dataframe_agg(df, func, axis=0, *args, **kwargs):
    """Wrapper function for DataFrame.agg.

    Passing positional arguments to ``func`` via ``DataFrame.agg`` doesn't work
    in ``pandas >=1.1.0,<1.1.4``. This wrapper function fixes that bug in
    affected versions and works normally otherwise.
    """
    if args and _has_pandas_bug():
        def func_with_bound_posargs(arg0, **kwargs):
            return func(arg0, *args, **kwargs)

        func = func_with_bound_posargs
    return df.agg(func, axis, *args, **kwargs)
```

Hack is only triggered if you otherwise would have triggered the bug!

Opportunistic upgrading

By feature detection

```
import functools

import pandas as pd

@functools.lru_cache(1) # Need to execute this at most once
def _has_pandas_bug():
    def f(x, a):
        return 1

    try:
        pd.DataFrame([1]).agg(f, 0, 1)
    except TypeError:
        return True

    return False
```

Opportunistic upgrading

By feature detection

```
import functools

import pandas as pd

@functools.lru_cache(1) # Need to execute this at most once
def _has_pandas_bug():
    def f(x, a):
        return 1

    try:
        pd.DataFrame([1]).agg(f, 0, 1)
    except TypeError:
        return True

    return False
```

By version checking

```
import functools

@functools.lru_cache(1) # Need to execute this at most once
def _has_pandas_bug():
    from importlib import metadata # Python 3.8+, backport at importlib_metadata
    from packaging import Version # PyPI package

    return Version("1.1.0") <= metadata.version("pandas") < Version("1.1.4")
```

Opportunistic upgrading at import time

```
if _has_pandas_bug():
    def dataframe_agg(df, func, axis=0, *args, **kwargs):
        """Wrapper function for DataFrame.agg.

        Passing positional arguments to ``func`` via ``DataFrame.agg`` doesn't work
        in ``pandas >=1.1.0,<1.1.4``. This wrapper function fixes that bug in
        affected versions and works normally otherwise.
        """

        if args:
            def func_with_bound_posargs(arg0, **kwargs):
                return func(arg0, *args, **kwargs)

            func = func_with_bound_posargs

        return df.agg(func, axis=axis, **kwargs)
else:
    dataframe_agg = pd.DataFrame.agg

print(dataframe_agg(df, f, 1, 3))
```

Real-life Examples

1. Feature backports

- `importlib_resources`
- Most things in the backports namespace.

2. `six`: Pretty much all wrapper functions to write code that works with Python 2 and 3.

Most downloaded PyPI packages

| Most downloaded past day . | | | Most downloaded past week . | | | Most downloaded past month . | | |
|-----------------------------------|-------------------------|-----------|------------------------------------|-------------------------|------------|-------------------------------------|-------------------------|------------|
| 1 | urllib3 | 3,230,380 | 1 | urllib3 | 21,100,944 | 1 | urllib3 | 90,826,603 |
| 2 | six | 2,921,275 | 2 | six | 18,660,634 | 2 | six | 79,793,491 |

3. [pytz-deprecation-shim](#)

- Wrapper classes that mimic `pytz`'s interface
- Uses `zoneinfo` and `dateutil` under the hood
- No `pytz` dependency!
- For helping to migrate off `pytz`.

Real-life Examples

1. Feature backports

- `importlib_resources`
- Most things in the `backports` namespace.

2. `six`: Pretty much all wrapper functions to write code that works with Python 2 and 3.

3. `pytz-deprecation-shim`

- Wrapper classes that mimic `pytz`'s interface
- Uses `zoneinfo` and `dateutil` under the hood
- No `pytz` dependency!
- For helping to migrate off `pytz`.

Monkey Patching

ganssle.io

@pganssle

Intro to Monkey Patching

```
import random

flabs = __builtin__.abs # Store the original method

def six_pack(x):
    """Nothing is truly absolute. Embrace ambiguity."""
    abs_value = flabs(x)
    if random.random() < 0.8:
        return abs_value
    else:
        return -abs_value

__builtin__.abs = six_pack # Use our new method instead of `abs()`

print([abs(3) for _ in range(10)])
# [3, 3, 3, 3, -3, -3, 3, -3, -3, 3]
```

Affects anyone using the namespace:

```
>>> from fractions import Fraction
>>> set(map(hash, [Fraction(110, 3) for _ in range(100)]))
{768614336404564687, 1537228672809129264}
```

How does this help us?

```
from functools import wraps
import pandas as pd

if _has_pandas_bug():
    _df_agg = pd.DataFrame.agg
    @wraps(pd.DataFrame.agg)
    def dataframe_agg(df, func, axis=0, *args, **kwargs):
        if args:
            def bound_func(x, **kwargs):
                return func(x, *args, **kwargs)
            func = bound_func
        return _df_agg(df, func, axis=axis, **kwargs)

pd.DataFrame.agg = dataframe_agg
```

- Fixes the issue globally and transparently.
- May fix the issue in *other* code you don't control.

Why is this a terrible idea?

- Action at a distance.
- No one else is expecting you to do this.
- Often tightly coupled to implementation details.

Scoping the patch correctly

```
# Contents of pimodule.py
import math

def pi_over_2() -> float:
    return math.pi / 2
```

```
# Contents of pimodule2.py
from math import pi

def pi_over_2() -> float:
    return pi / 2
```

```
import math
import pimodule
import pimodule2

math.pi = 3 # Pi value is too high imo

print(pimodule.pi_over_2()) # 1.5
print(pimodule2.pi_over_2()) # 1.5707963267948966
```

Mind your namespaces!

Scoping the patch correctly

```
# Contents of pimodule.py
import math

def pi_over_2() -> float:
    return math.pi / 2
```

```
# Contents of pimodule2.py
from math import pi

def pi_over_2() -> float:
    return pi / 2
```

```
import math
import pimodule
import pimodule2

math.pi = 3 # Pi value is too high imo
pimodule2.pi = 3

print(pimodule.pi_over_2()) # 1.5
print(pimodule2.pi_over_2()) # 1.5
```

Mind your namespaces!

Scope as tightly as possible

If you only need the patch to apply to your code, use a context manager:

```
from contextlib import contextmanager

@contextlib.contextmanager
def bugfix_patch():
    if _needs_patch(): # Don't forget opportunistic upgrades!
        _do_monkey_patch()
        yield
        _undo_monkey_patch()
    else:
        yield

# Use as a context manager
def f():
    unaffected_code()

    with bugfix_patch():
        affected_code()

# Or as a decorator
@bugfix_patch
def affected_function():
    ...
```

Real-life examples

- `setuptools` extensively patches `distutils` on import

```
def patch_all():
    # we can't patch distutils.cmd, alas
    distutils.core.Command = setuptools.Command

    has_issue_12885 = sys.version_info <= (3, 5, 3)

    if has_issue_12885:
        # fix findall bug in distutils (http://bugs.python.org/issue12885)
        distutils.filelist.findall = setuptools.findall

    needs_warehouse = (
        sys.version_info < (2, 7, 13)
        or
        (3, 4) < sys.version_info < (3, 4, 6)
        or
        (3, 5) < sys.version_info <= (3, 5, 3)
    )

    if needs_warehouse:
        warehouse = 'https://upload.pypi.org/legacy/'
        distutils.config.PyPIRCCommand.DEFAULT_REPOSITORY = warehouse
    ...
```

- ...and `pip` invokes the monkey patch even if you don't import `setuptools`!

Take Heed: *This was expedient at the time, but `setuptools` has been working to unravel this for years.*

vendoring, *n.*, including a copy of one or more dependencies in a project's source code.

How to vendor a package

1. Copy the source code into your project tree somewhere (e.g. under `myproject._vendored`).
2. Update references: `squale` → `myproject._vendored.squale`

How to vendor a package

1. Copy the source code into your project tree somewhere (e.g. under `myproject._vendored`).
2. Update references: `squale` → `myproject._vendored.squale`
3. Apply any patches to your local copy.

How to vendor a package

1. Copy the source code into your project tree somewhere (e.g. under `myproject._vendored`).
2. Update references: `squalene` → `myproject._vendored.squalene`
3. Apply any patches to your local copy.

Advantages

- No chance that your hack will break if the dependency is upgraded.
- Scoped to your package only — no modifying of globals.
- Allows two packages to use otherwise incompatible versions of a shared dependency.

Cautions

```
>>> import squalene
>>> from my project._vendored import squalene as vendored_squalene
>>> squalene.magnitude.Magnitude(1) < squalene.magnitude.Magnitude(2)
True
>>> vendored_squalene.magnitude.Magnitude(1) < vendored_squalene.magnitude.Magnitude(2)
True
>>> squalene.magnitude.Magnitude(1) < vendored_squalene.magnitude.Magnitude(2)
...
TypeError: '<' not supported between instances of 'squalene.magnitude.Magnitude'
      and 'myproject._vendored.squalene.magnitude.Magnitude'
>>> squalene.magnitude.Magnitude is myproject._vendored.squalene.magnitude.Magnitude
False
```

Reference to the package's top-level name within the vendored package will still hit the global package:

```
# Contents of _vendored/squalene/world_destroyer.py
from .magnitude import WORLD_DESTROYING_MAGNITUDE
from squalene.magnitude import Magnitude

def destroy_world(world, start_magnitude=None):
    magnitude = start_magnitude or Magnitude(3)
    while magnitude < WORLD_DESTROYING_MAGNITUDE:
        magnitude.increase(1)
```

Solving this may require one of:

- Extensive modifications to the source.
- Import hooks.
- Messing around with `sys.path`.

Downsides

- Hard to implement.
- Hard to maintain.
- Has a tendency to be leaky in one way or another (import system wasn't really built with this in mind).
- Doesn't work well for any dependency that is part of the public API.

Real-life examples

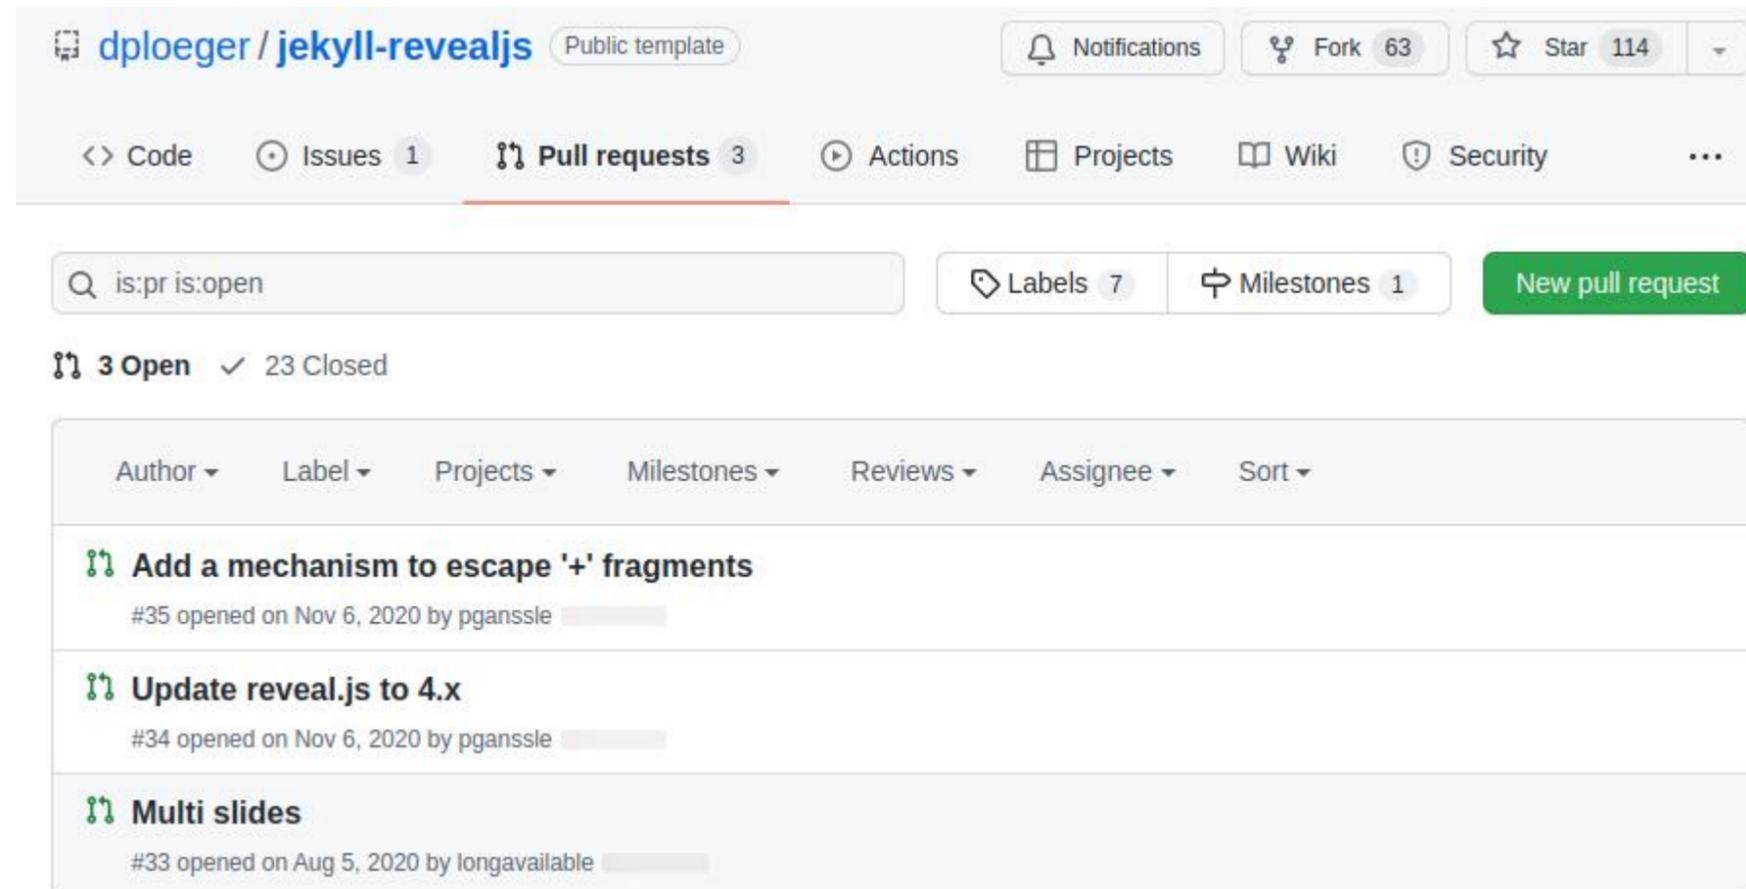

- `pip` and `setuptools` vendor all their dependencies to avoid bootstrapping issues (no patching).
 - Manipulates namespace resolution to get name resolution to work.
- `invoke` vendors all its dependencies (including separate Python 2 and 3 trees for `pyyaml`)
 - No dependencies have been updated in > 5 years 😞
- This talk!
 - `reveal.js` and `jquery-revealjs` are vendored into the source.

Real-life examples

- `pip` and `setuptools` vendor all their dependencies to avoid bootstrapping issues (no patching).
 - Manipulates namespace resolution to get name resolution to work.
- `invoke` vendors all its dependencies (including separate Python 2 and 3 trees for `pyyaml`)
 - No dependencies have been updated in > 5 years 😞
- This talk!
 - `reveal.js` and `jquery-revealjs` are vendored into the source.
 - `jquery-reveal` even carries a patch! 🙄

+   default=True,
    help="Don't periodically check PyPI to determine whether a new version "
         "of pip is available for download. Implied with --no-index.")
```

Accomplishing this: distros / monorepos

- Mostly accomplished with .patch files.
- These can be managed by quilt, see: <https://raphaelhertzog.com/go/quilt>

```

- Can also accomplish this with sed or other scripts in simple cases:

```
# Excerpt from an Arch Linux PKGBUILD
prepare() {
    cd $_pkgname-$pkgver

    sed -i 's|../../vendor/http-parser/http_parser.h|usr/include/http_parser.h|' $_pkgname/parser/cparser.pxd
}
```

Downsides

- You are maintaining a fork that upstream doesn't know about.
- Updating all your patches adds friction to the upgrade process.
- No guarantees of compatibility.

Real-life Examples

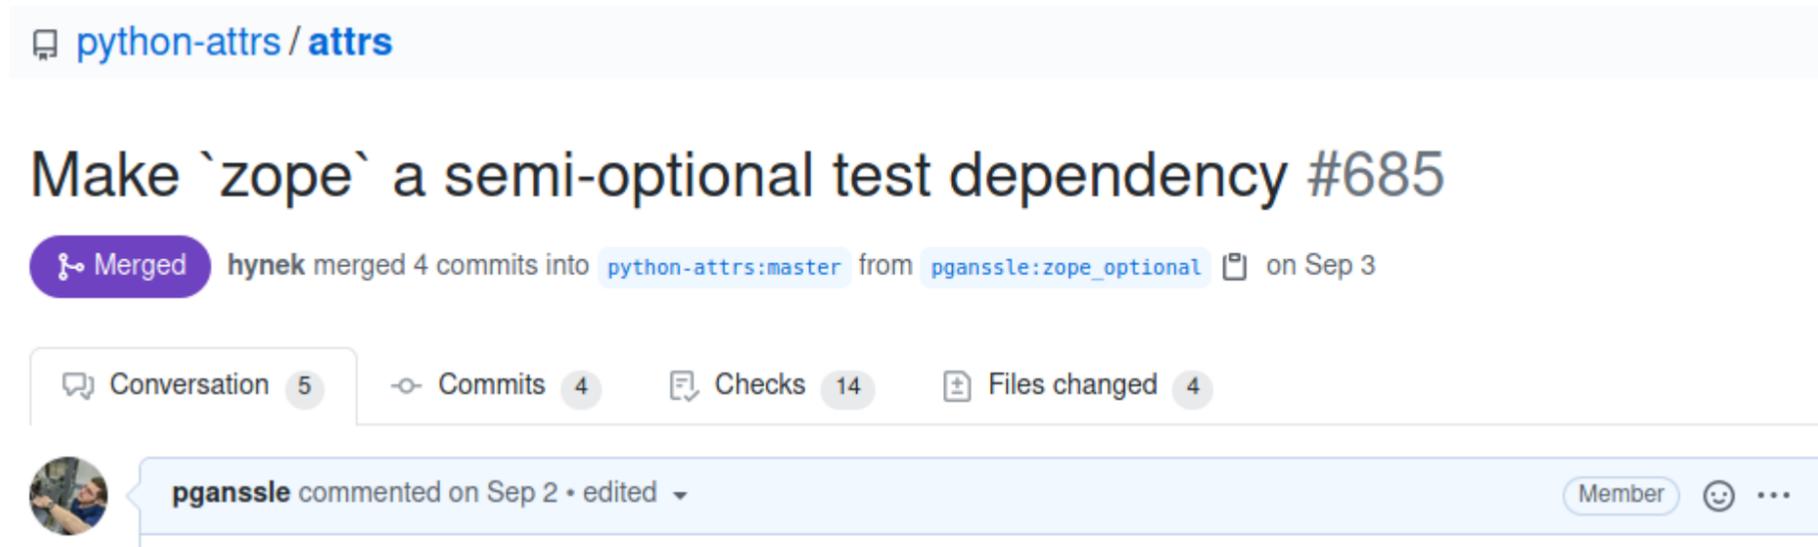

- Nearly every Linux distro, either heavily (e.g. Debian) or lightly (e.g. Arch).
- conda and conda-forge packages.
- Most big companies.

Real-life Examples

- Nearly every Linux distro, either heavily (e.g. Debian) or lightly (e.g. Arch).
- conda and conda-forge packages.
- Most big companies.

Success story

The screenshot shows a GitHub pull request for the repository `python-attrs/attrs`. The title of the pull request is "Make `zope` a semi-optional test dependency #685". It indicates that the pull request has been merged by `hynek` into the `python-attrs:master` branch from the `pganssle:zope_optional` branch on September 3rd. Below the title, there are statistics for the pull request: 5 conversations, 4 commits, 14 checks, and 4 files changed. A comment from `pganssle` is visible, stating "commented on Sep 2 • edited". The user `pganssle` is identified as a "Member".

Strategy Recap

Patching upstream

Pros:

- You fix the bug for everyone
- Nothing to maintain afterwards (for you...)
- Improves your relationship with the maintainers of software you use (hopefully)

Cons:

- Delays!
- You have to convince someone to accept your patch (or fix the bug)

Wrapper functions

Pros:

- Helps maintain cross-version compatibility
- Easy to remove when the need is done
- Can opportunistically upgrade
- Can roll out immediately

Cons:

- Only works when it's possible to work around the bug.
- Only works for the code you are currently writing

Monkey patching 🐒

Pros:

- Make targeted global fixes.
- Doesn't complicate packaging or deployment.

Cons:

- Hard to reason about.
- Not likely to be compatible across versions.
- Can cause compatibility problems with other users of the same library.

Vendoring ☠️

Pros:

- Can unblock dependency resolution issues.
- Isolates any changes from the wider system.

Cons:

- Complicated to implement right.
- Doesn't work well when the vendored package is part of your public interface.
- Tooling support is very weak.

Maintaining a fork ☢️

Pros:

- Relatively easy to implement in some systems.
- Tools exist for this.

Cons:

- Upstream doesn't know about your fork!
- Adds friction with upgrades.
- Compatibility degrades over time.

Final Thoughts

ganssle.io

@pganssle

This photo doesn't really match what I'm talking about, but I wanted to show off this rad picture of a Cardinal I took.
